Dynamic, compact, reliable

Servo motors

Lenze

Lenze

No matter which drive solution you imagine, we make your dreams come true.

True to our slogan (one stop shopping) we offer you a complete programme of electronic and mechanical drive systems which is distinguished by reliability and efficiency.

The scope of our programme includes frequency inverters, servo controllers, variable-speed drives, speed reduction gearboxes, motors, brakes, clutches, decentralised I/O and operator and display units.

Many well-known companies use Lenze products in various applications.

Lenze servo motors | Dynamic, compact, reliable

Lenze servo drives satisfy the highest demands in terms of quality and impress with their carefully considered and application-focused design. This enables them to meet the increasingly stringent demands that are now placed on drive systems by mechanical and system engineering companies. Servo motors that are an integral part of a drive axis are easy to install and offer an long, maintenance-free service life.

Lenze has developed three different ranges of servo motors for different applications. In all three, heavy-duty bearings with high-temperature resistant grease and a reinforced insulation concept ensure long and reliable operation – even under harsh operating conditions.

The synchronous servo motors of the MCS range have been designed for extremely dynamic applications with a high overload capacity. The through-blown asynchronous servo motors in the MDFQA range have been tailored to harsh continuous load operations. Finally, the MCA is a successful range of durable and universally applicable asynchronous servo motors for high-speed applications. All Lenze motors offer the same high levels of technical perfection, user-friendliness and ease of handling in a power range from 0.25 kW to 95 kW, with continuous torque values in the range from 0.5 Nm to 434 Nm and peak torque values of up to 1600 Nm.

Lenze | An introduction

Lenze is the competent partner for your application. Lenze is not only a supplier for single components but also offers solutions for complete drive systems including planning, execution and commissioning.

Furthermore, a worldwide service and distribution network lets you engage a qualified customer advisory service and an after sales service that is fast and extensive.

Our quality assurance system for design, production, sales and service is certified according to DIN ISO 9001 : 2000. Our environmental management system is also certified to DIN EN ISO 14001.

Our customers set the standards for measuring the quality of our products. Our task is to meet your requirements, since customer orientation is a Lenze principle demanding the best quality.

See for yourself.

A worldwide service –
Our team of experts provides reliable and professional assistance.

A true system | Drive and automation technology

Products which are setting the pace in terms of technology and complete drive solutions for machine and system production - just what Lenze is all about. We provide our customers with frequency and servo inverters with powers up to 400 kW. We support both central control cabinet solutions and decentralised drive concepts, e.g. with motor inverters with IP65 type of protection.

Both standard three-phase AC motors and synchronous and asynchronous servo motors are available to complement the various controllers, all of which can be combined with various types of gearboxes. Human Machine Interfaces, decentralised I/O systems and modules for fieldbus interfacing are also available for exchanging information.

Lenze boasts extensive application know-how in all manner of industries. This knowledge has been applied in the design of the controller and PC software, providing an efficient means of implementing numerous standard applications using simple parameter settings.

An all-round service comprising component selection advice, training, commissioning support and even a helpline which can be accessed all over the world and independent system engineering completes the offer.

Lenze servo motors

Servo drive systems are nowadays subjected to the most stringent demands. The Global Drive System from Lenze has succeeded in ensuring that the differing drive unit components all complement each other perfectly. The Lenze servo motors have an important role to play in this system. Tailored to various applications, synchronous and asynchronous motors that have been optimised to satisfy the various requirements in terms of dynamic response, accuracy and drive behaviour, are available across a wide torque and power range.

Dynamic

All Lenze servo motors feature a low moment of inertia and a high overload capacity. Continuous temperature measurement using an integrated thermal sensor delivers an optimal control response that is more or less temperature independent.

When combined with 9300 range servo inverters or the ECS servo system, high speed precision, ideal smooth running characteristics and high angular accelerations can be achieved.

Precise

In combination with the specially designed neodymium iron boron (NdFeB) high-energy magnets, the new SEpT design^{*)} enables a distortion-free, entirely sinusoidal working field to be generated on MCS synchronous servo motors. This ensures both excellent smooth running characteristics (due to the absence of field distortion) and maximum power density (as the working field is generated almost entirely from the induced energy). This optimised field form also eliminates practically all distorting cogging and latching torques.

Long service life

The high quality levels that Lenze demands of the components in question satisfy the requirements placed on modern drive systems in terms of operational reliability and service life. A reinforced insulation system with thermal reserve (enamel-insulated wire to temperature class H, for class F use) ensures the long operating life of the winding. The fully-encapsulated stator also ensures the winding is thoroughly protected, even in the event of severe vibration, and allows heat to be dissipated more effectively: the result is an increase in load capacity and a long trouble-free service life.

Pretensioned and generously dimensioned roller bearings with high-temperature resistant grease guarantee a long service life for the bearings as well.

^{*)} SePT: Single Element Pole Technology.

Operational reliability

The IP54 version of the MCS and MCA series provides a good degree of protection from dust and water. If the drives require even more protection, the MCS and MCA motors are also available in an IP65 version.

CE conformity

All Lenze servo motors naturally meet the requirements of the following EU guidelines:

- ▶ CE conformity with the low voltage directive
- ▶ CE conformity with the electromagnetic compatibility directive for a typical drive configuration with inverter

The use of integrated system cables makes it easy to maintain electromagnetic compatibility.

UL certification

All Lenze servo motors in the MCS and MCA series are designed for use in the Americas and are supplied UR certified (exception: version with 205V brake).

No compromises where output speed is concerned

The large ratio range of Lenze gearboxes, combined with the small ratio step of 1.12, allows the required output speed range to be chosen very precisely. The ability to connect the gearboxes directly in the case of the MCS and MCA servo motors produces an extremely compact drive unit with a minimal unit volume. It goes without saying that all Lenze servo motors can also be combined with gearboxes in the conventional manner.

Adaptable

The modular structure of the motors and the concept-based variants will help you to choose the right solution for any application.

The numerous output designs of the motors and geared motors mean that the drives can be adapted to almost any drive task:

- ▶ Servo motors with cylindrical shaft end with or without keyway
- ▶ Servo geared motors with solid shaft, hollow shaft or hollow shaft with shrink disk
- ▶ Servo geared motors with or without flange, foot or centring
- ▶ A range of integral phase angle sensors allows the motors to be configured to achieve the required accuracy: resolvers are the standard solution with optimised response resulting from internal improvements in resolver accuracy, SinCos absolute value encoders for the greatest precision or even incremental encoders for general applications
- ▶ Tailored to the relevant motor type, permanent magnet or spring-applied holding brakes with differing torque ranges ensure exact positioning in all application scenarios, even when the drive is de-energised

Quiet

The high chopper frequencies of the inverters (up to 16 kHz) and a cleverly designed magnetic circuit result in extremely low noise levels. Optimised gear teeth geometry in the Lenze gearboxes prevents noise developing, while the internally ribbed cast iron gearbox housing also helps reduce noise levels.

Compact

The high power density of all Lenze servo motors encourages the development of small, highly dynamic drive units. The use of servo geared motors with direct mounting of the motors to the gearbox makes for particularly compact drives.

Reduced backlash

The use of zero backlash permanent magnet holding brakes enables defined holding of a position even if the drive has been disconnected from the power supply.

The low backlash joining elements on the Lenze gearboxes and high teeth quality due to precision manufacturing minimise output backlash on the servo geared motors in comparison with similar gearboxes.

For the highest requirements with respect to reduced backlash, all MCS and MCA servo motors can be combined with flange-mounted GPA series planetary gearboxes. It goes without saying that here, as with all motor-gearbox combinations, we are committed to using friction-type connections, which can also reliably handle highly dynamic servo applications.

Special models

We can also provide special models tailored to meet the requirements of specific applications.

Easy to install

All Lenze servo motors are guaranteed to be extremely easy to install, with short down times whenever one needs to be replaced. All connectors on the MCS and MCA motors are keyed to prevent incorrect connection and can be turned through about 240° to allow them to be fitted and removed easily in all situations.

Easy-to-install housing format on MCS synchronous servo motors

Please contact us should you require more information.

Detailed Operating Instructions for all Lenze servo motors can be found on the Download pages at www.Lenze.de

1) Without brake, with resolver.

2) Magnetically/mechanically permissible torque.

General data

	Synchronous servo motors MCS	Asynchronous servo motors MCA	Asynchronous servo motors MDFQA
Enclosure	IP54/IP65 (naturally ventilated only)		IP23
Thermal class	Utilisation to temperature class F (VDE 0530) Insulation system (enamel-insulated wire) to thermal class H		
UL conformance	UR recognised component File no. E 210321		UL version (on request*)
Insulation resistance	Maximum voltage amplitude $\hat{U} = 1.5 \text{ kV}$ Maximum rate of voltage rise $du/dt = 5 \text{ kV}/\mu\text{s}$		
Vibration level	N	N Frame size 10 and 13 R above size 14	N
Smooth running, run-out, concentricity	N	N Frame size 10 and 13 R above size 14	N
Mechanical tolerance	Diameter of shaft end $d \text{ } \varnothing 11$ to $\varnothing 38$: k6, at $\varnothing 55$: m6 Diameter of centring flange b1: J6		
Temperature monitoring	KTY 83 – 110 + 2x PTC 150° MCS06: 1 x KTY 83 – 110 **)	Continuous temperature sensor (KTY 83 – 110) (full protection not provided)	KTY combined with thermo-switch
Connection	1 connector each for: motor and brake, resolver and temperature sensor, blower (MCA above frame size 13) or terminal box		motor connection as terminal box, encoder connection with plug
Temperature range	–20 to +40 °C with no power reduction (without brake, unventilated) –10 to +40 °C with no power reduction (with brake) forced ventilation: –15 to +40 °C		
Air humidity	up to 85 % no condensation		
Surface temperature	up to 140 °C	Naturally-ventilated motors up to 140 °C Forced ventilated motors up to 110 °C	up to 110 °C
Site altitude	up to 1000 m amsl with no power reduction, with power reduction up to 4000 m		
Demagnetising limit	$>5 \cdot I_N$ with natural ventilation	No demagnetisation possible	
Maximum torque	$>4 \cdot M_N$	$>5 \cdot M_N$	
Rated speed	1350 – 6000 rpm	1635 – 4160 rpm	550 – 2935 rpm
Phase angle sensor	Resolver/SinCos absolute value encoder	Resolver/Incremental encoder/SinCos absolute value encoder SinCos encoder	
Type	B5	B5 / B14	B5 / B35
Storage	Deep-groove ball bearing with high-temperature resistant grease, sealing disc/cover plate Locating bearing on the B-side	Locating bearing on the A-side	Locating bearing on the B-side
Shaft end	with/without keyway		
Brake	with/without permanent-magnet holding brake		with/without spring-applied brake
Fan	naturally ventilated only	Axial fan above frame size 13 possible	Radial-flow fan
Colour	Black, RAL 9005		

*) Optional: UR recognised component
File No. E 210321
(not: MDFQA 160).

**) No full protection.

Influence of ambient temperature and installation height

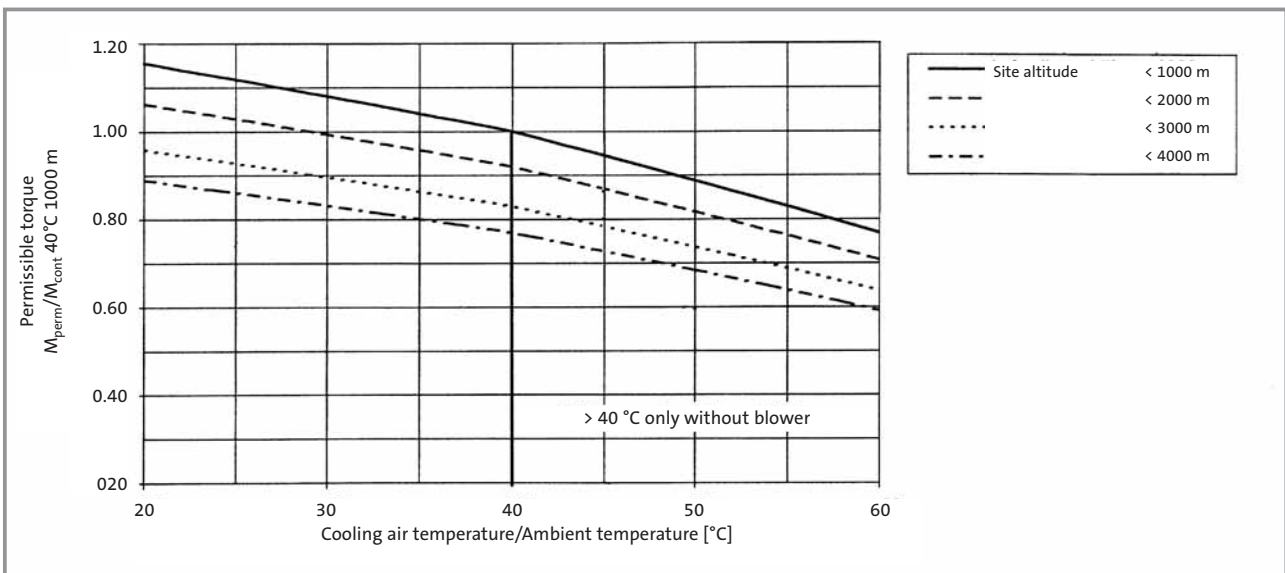

All values given in tables and diagrams for the servo motors are valid for a maximum ambient temperature of 40°C and an installation height up to 1000 m amsl.

If installation conditions differ, the correction factors below should be taken into account.

MCS synchronous servo motors

MCA and MDFQA asynchronous servo motors, on motors with blower MCA ... F 10 and MDFQA Maximum ambient temperature 40 °C

MCS synchronous servo motors have been developed in particular for dynamic drive tasks and therefore feature very high standstill and maximum torques. These optimised characteristics enable a smaller motor to be selected for many applications than if the motor was dimensioned in accordance with the rated data.

A brief overview of the most important data and relationships for dimensioning a servo motor appears below:

1

Gearbox ratio:

▶ for optimum dynamics

$$i \approx \sqrt{\frac{J_{load}}{J_{mot}}}$$

▶ for optimum utilisation in continuous operation

$$i \approx \frac{n_N}{n_{load}}$$

Maximum torque:

$$M_{max} = M_{accel} + \frac{1}{i} \frac{1}{\eta_{gearbox}} M_{load}$$

$$M_{accel} = 2 \cdot \pi \frac{\Delta n}{\Delta t} \left(J_{mot} + \frac{1}{i^2} J_{load} \right)$$

The thermal design of the motor takes the effective torque and the average speed into account. In the case of short load cycle steps and cycle times < 1 min, the following applies:

r.m.s. torque:

$$M_{eff} = \sqrt{\frac{1}{T} \sum_i M_i^2 \cdot t_i}$$

Average speed:

$$n_m = \frac{1}{T} \sum_i |n_i \cdot t_i|$$

If n_m, M_{rms} are located below the characteristic for continuous operation or the following relationship is true

$$M_{rms} \leq M_0 + (M_n - M_0) \cdot \frac{n_m}{n_n}$$

and all working points M_i, n_i are below the torque limit line, then the thermal design of the motor is correct.

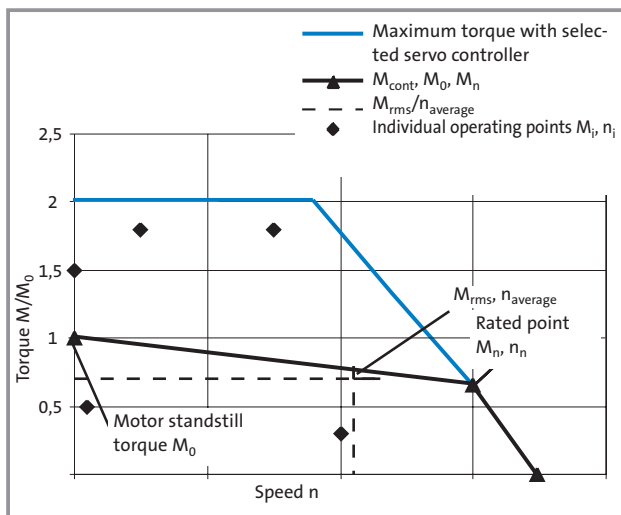

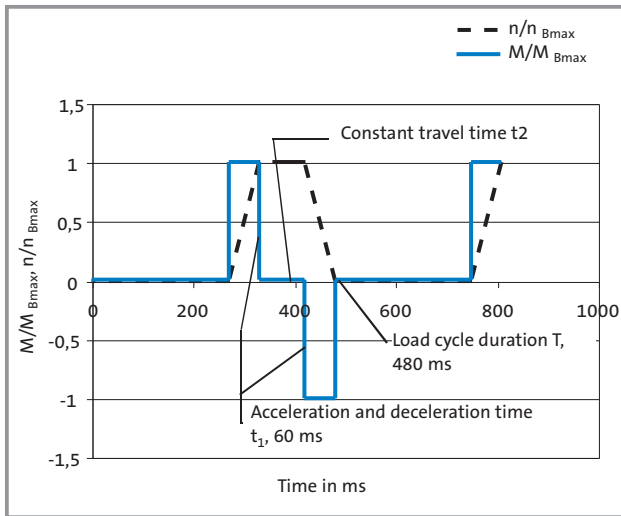

Illustration of correct thermal motor design: lines M_{rms} and $n_{average}$ intersect below the characteristic for continuous operation, and all working points M_i, n_i are below the torque limit line (dependent on motor and servo controller).

If the drive task involves a **cyclic motion sequence**, as shown on page 1-15, the following relationships for M_{eff} and n_m apply:

$$M_{rms} = \sqrt{\frac{2t_1}{T} M_{max}^2} \quad n_m = \frac{t_1 + t_2}{T} n_{max}$$

To illustrate an example calculation for an MCS 19 servo motor connected to an EVS 9328 servo controller:

Motion diagram for example calculation

Example calculation

Values for the example illustrated in the diagram:

$$t_1 = 60 \text{ ms} \quad t_2 = 90 \text{ ms} \quad T = 480 \text{ ms}$$

$$n_{Bmax} = 2300 \text{ rpm} \quad M_{Bmax} = 100 \text{ Nm}$$

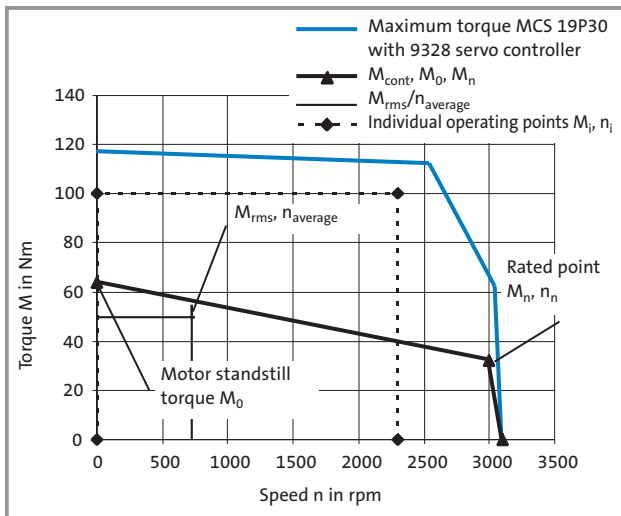

$$M_{rms} = \sqrt{\frac{2 \cdot 60 \text{ ms}}{480 \text{ ms}} \cdot M_{Bmax}^2} = 0.5 \cdot M_{Bmax} = 50 \text{ Nm}$$

$$n_m = \frac{60 + 90}{480} n_{Bmax} = 0.3125 \cdot n_{Bmax} = 720 \text{ rpm}$$

Selected motor:

MCS 19P30 with data

$M_0 = 64 \text{ Nm}$ and $M_n = 32 \text{ Nm}$

The motor is suitable for the drive, although the rated torque (32 Nm) is less than $\frac{1}{3}$ of the drive torques required in the example:

- 1) The operating point calculated from the effective torque (50 Nm) and the average speed (720 rpm) is below the characteristic for continuous operation.
- 2) All working points are below the maximum torque characteristic of MCS 19P30 with the EVS 9328 servo controller ($I_{max \text{ controller}} = 70.5 \text{ A}$).

MCS synchronous servo motors

MCS synchronous servo motors are the ideal solution wherever maximum dynamics and maximum precision need to be combined with minimum dimensions.

The stator winding on the MCS motors has been created using a new production method based on the SEpT design*). When combined with high-quality neodymium iron boron magnets outstanding drive characteristics can be achieved. On the one hand this design ensures a signifi-

cant increase in power density whilst at the same time reducing the moment of inertia and therefore achieves excellent dynamic characteristics. On the other hand, smooth running characteristics can be optimised and detent torques minimised. The robust design with large bearings and the high degree of protection also ensure high operational reliability and long service life even under harsh conditions.

Short-time operation characteristic

Lenze MCS servo motors are designed to be used in dynamic applications with high torque peaks. In order to make full use of this highly dynamic response as simply as possible,

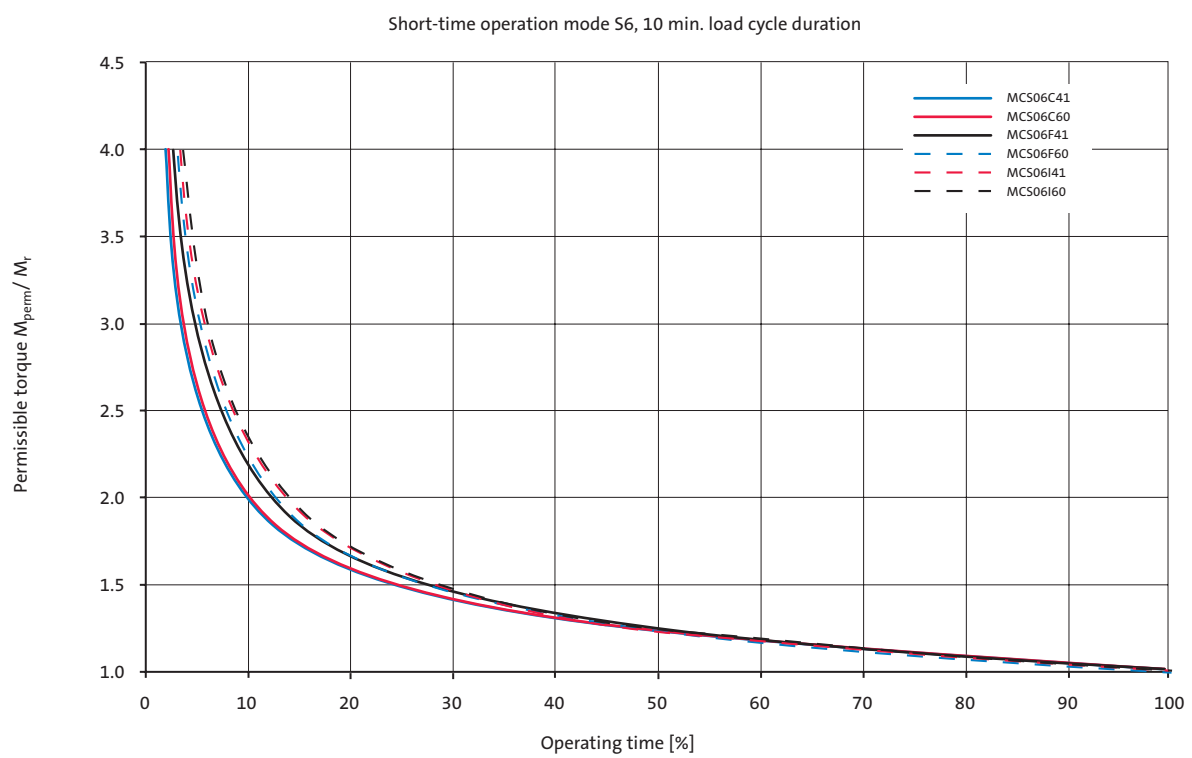

the following diagrams for operating modes S2 and S6 illustrate the permissible operating times against the torque peaks required.

Technical data

MCS 06 synchronous servo motors

Technical data

MCS 06 synchronous servo motors

Brake assignment

MCS synchronous servo motors can be fitted with integrated permanent magnet holding brakes for 24 V DC.

The brakes are activated when the supply voltage is disconnected (closed-circuit current principle).

If the brakes are used purely as holding brakes, there will be virtually no evidence of wear on the friction surfaces. As long as the permissible switching rate is not exceeded, at least 2000 emergency stop functions will be possible.

MCS 06C41, MCS 06C60
MCS 06F41, MCS 06F60
MCS 06I41, MCS 06I60

Type	Size	Holding torque M_4 20 °C Nm	Holding torque M_4 120 °C Nm	Average dynamic torque M_{1m} 120 °C Nm	$U_B^{3)}$ +5 % – –10 % V	$I_B^{2)}$ A	J_B kg m ² · 10 ⁻⁴	Engage- ment time $t_1^{1)}$ ms	Disen- gage- ment time $t_2^{1)}$ ms	Maximum- switching rate per emergency stop with n = 3.000 rpm J	Weight kg
P1	04H	2.2	2	0.6	24	0.34	0.12	15	30	29.6	0.27

1) Engagement and disengagement times valid for rated voltage (± 0%) and protective circuit for brakes with varistor for DC-controlled switching. The times may increase without a protective circuit.

2) The currents are maximum values for a cold brake (data for dimensioning the power supply). The values for a motor at operating temperature are considerably lower.

3) Smoothed DC voltage, ripple < 1%.

Permissible moments of inertia

Motor	Brake type	J_{mot} with brake kg m ² · 10 ⁻⁴	Permissible J_{load} / J_{mot}
MCS 06C	P1	0.26	22.1
MCS 06F	P1	0.34	16.6
MCS 06I	P1	0.42	13.3

If the permissible moments of inertia opposite are adhered to, the permissible maximum switching rate of the brake will not be exceeded and up to 2000 emergency stop functions will be possible at a speed of 3000 rpm .

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e.g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input. The following applies to Lenze system cables:

$$U^*[V] = U_B [V] + 0.08 \left[\frac{V}{A \cdot m} \right] \times l_{cable} [m] \times I_B [A]$$

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

Technical data

MCS 12 synchronous servo motors

Short-time operation characteristic

Lenze MCS synchronous servo motors are designed to be used in dynamic applications with high torque peaks. In order to make full use of this highly dynamic response as simply as possible, the following diagrams for operating

modes S2 and S6 illustrate the permissible operating times against the torque peaks required.

Technical data

MCS 12 synchronous servo motors

Brake assignment

MCS synchronous servo motors can be fitted with integrated permanent magnet holding brakes for 24 V DC.

The brakes are activated when the supply voltage is disconnected (closed-circuit current principle).

If the brakes are used purely as holding brakes, there will be virtually no evidence of wear on the friction surfaces. As long as the permissible switching rate is not exceeded, at least 2000 emergency stop functions will be possible.

MCS 12H MCS 12L

Type	Size	Holding torque M_4 20 °C Nm	Holding torque M_4 120 °C Nm	Average dynamic torque M_{1m} 120 °C Nm	$U_B^{3)}$ +5 % – -10 % V	$I_B^{2)}$ A	J_B $\text{kg m}^2 \cdot 10^{-4}$	Engage- ment time $t_1^{1)}$ ms	Disen- gage- ment time $t_2^{1)}$ ms	Maximum- switching rate per emergency stop with $n = 3000 \text{ rpm}$ J	Weight kg
P1	07H	12	10	7	24	0.65	1.07	13	43	400	0.9
P2	09H	24	19	12	24	0.71	3.13	16	90	890	1.2

P1 Standard brake

P2 Reinforced brake

¹⁾ Engagement and disengagement times valid for rated voltage ($\pm 0\%$) and protective circuit for brakes with varistor for DC-controlled switching. The times may increase without a protective circuit.

²⁾ The currents are maximum values for a cold brake (data for dimensioning the power supply). The values for a motor at operating temperature are considerably lower.

³⁾ Smoothed DC voltage, ripple < 1%.

Permissible moments of inertia

Motor	Brake type	J_{mot} with brake $\text{kg m}^2 \cdot 10^{-4}$	Permissible $J_{\text{load}}/J_{\text{mot}}$
MCS 12H	P1	8.4	8.7
MCS 12L	P1	11.7	6.0
MCS 12H	P2	10.4	16.3
MCS 12L	P2	13.7	12.1

If the permissible moments of inertia opposite are adhered to, the permissible maximum switching rate of the brake will not be exceeded and up to 2000 emergency stop functions will be possible at a speed of 3000 rpm^{-1} .

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e. g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input. The following applies to Lenze system cables:

$$U^*[\text{V}] = U_B [\text{V}] + 0.08 \left[\frac{\text{V}}{\text{A} \cdot \text{m}} \right] \times I_{\text{cable}} [\text{A}] \times l_B [\text{m}]$$

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

Mechanical dimensions

Motor type	Motor without holding brake			Motor with holding brake		
	k [mm]	l [mm]	lx [mm]	k [mm]	l [mm]	lx [mm]
MCS 12H	228	268	317	248	288	337
MCS 12L	268	308	357	288	328	377

l Motor length with installation of a resolver as feedback
lx Motor length with installation of an absolute value encoder as feedback

Permissible shaft loads

Forces on the motor shaft

The following diagrams provide a simple means of determining:

- a) the service life of the roller bearings on the basis of the forces and torques calculated.

Service life is calculated as follows:

$$\frac{\text{Number of bearing revolutions}}{n \text{ [rpm]} \times 60} = \text{bearing service life [h]}$$

- b) the maximum permissible radial force and the associated maximum permissible torsional moment on the motor shaft. Depending on the ambient temperatures, the service life of the bearings is also reduced by the grease lifetime.

The characteristics are valid for all MCS 12 frame sizes

Permissible radial force F_{r1} and axial force F_a on shaft

Permissible radial force F_{r2} and axial force F_a on shaft

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive.

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

Permissible shaft loading

Relationship between radial force and torsional moment on the shaft.

Technical data

MCS 14 synchronous servo motors

Short-time operation characteristic

Lenze MCS synchronous servo motors are designed to be used in dynamic applications with high torque peaks. In order to make full use of this highly dynamic response as simply as possible, the following diagrams for operating

modes S2 and S6 illustrate the permissible operating times against the torque peaks required.

Technical data

MCS 14 synchronous servo motors

Brake assignment

MCS synchronous servo motors can be fitted with integrated permanent magnet holding brakes for 24 V DC.

The brakes are activated when the supply voltage is disconnected (closed-circuit current principle).

If the brakes are used purely as holding brakes, there will be virtually no evidence of wear on the friction surfaces. As long as the permissible switching rate is not exceeded, at least 2000 emergency stop functions will be possible.

MCS 14D36, MCS 14D15
MCS 14H32, MCS 14H15
MCS 14L32, MCS 14L15
MCS 14P32, MCS 14P14

Type	Size	Holding torque $M_{20^\circ\text{C}}$ Nm	Holding torque $M_{120^\circ\text{C}}$ Nm	Average dynamic torque $M_{120^\circ\text{C}}$ Nm	$U_B^{3)}$ +5% – -10% V	$I_B^{2)}$ A	J_B $\text{kg m}^2 \cdot 10^{-4}$	Engage- ment time $t_1^{1)}$ ms	Disen- gage- ment time $t_2^{1)}$ ms	Maximum switching range per emergency stop with $n = 3000$ rpm J	Weight kg
P1	09H	22	18	8	24	0.88	3.20	15	150	640	1.9
P2	11H	37	32	15	24	0.93	12.4	96	113	2350	3.1

P1 Standard brake

P2 Reinforced brake

¹⁾ Engagement and disengagement times valid for rated voltage ($\pm 0\%$) and protective circuit for brakes with varistor for DC-controlled switching. The times may increase without a protective circuit.

²⁾ The currents are maximum values for a cold brake (data for dimensioning the power supply). The values for a motor at operating temperature are considerably lower.

³⁾ Smoothed DC voltage, ripple $< 1\%$.

Permissible moments of inertia

Motor	Brake type	J_{mot} with brake $\text{kg m}^2 \cdot 10^{-4}$	Permissible $J_{\text{load}}/J_{\text{mot}}$
MCS 14D	P1	11.3	10.5
MCS 14H	P1	17.4	6.5
MCS 14L	P1	26.6	3.9
MCS 14P	P1	37.9	2.4
MCS 14D	P2	20.5	22.2
MCS 14H	P2	26.6	16.9
MCS 14L	P2	35.8	12.3
MCS 14P	P2	47.1	9.1

If the permissible moments of inertia opposite are adhered to, the permissible maximum switching rate of the brake will not be exceeded and up to 2000 emergency stop functions will be possible at a speed of 3000 rpm.

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e.g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input. The following applies to Lenze system cables:

$$U^*[\text{V}] = U_B [\text{V}] + 0.08 \left[\frac{\text{V}}{\text{A} \cdot \text{m}} \right] \times I_{\text{cable}} [\text{A}] \times l_B [\text{m}]$$

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

Mechanical dimensions

Motor type	Motor without holding brake				Motor with holding brake			
	i [mm]	k [mm]	l [mm]	lx [mm]	i [mm]	k [mm]	l [mm]	lx [mm]

- l Motor length with installation of a resolver as feedback
- lx Motor length with installation of an absolute value encoder as feedback
- i Package length

Permissible shaft loads

Forces on the motor shaft

The following diagrams provide a simple means of determining:

- a) the service life of the roller bearings on the basis of the forces and torques calculated.

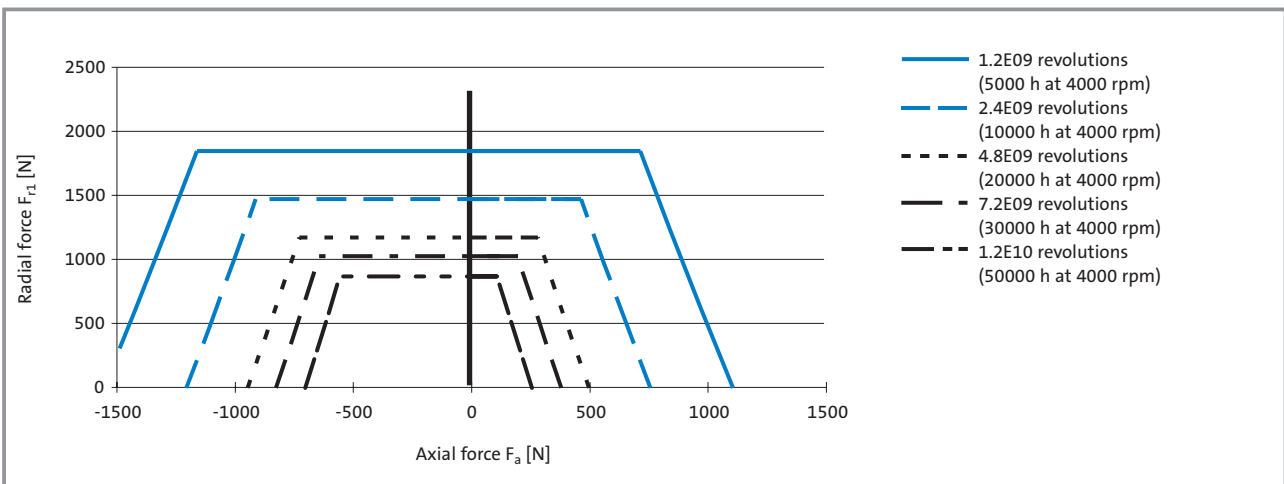

Service life is calculated as follows:

$$\frac{\text{Number of bearing revolutions}}{n \text{ [rpm]} \times 60} = \text{bearing service life [h]}$$

- b) the maximum permissible radial force and the associated maximum permissible torsional moment on the motor shaft. Depending on the ambient temperatures, the service life of the bearings is also reduced by the grease lifetime.

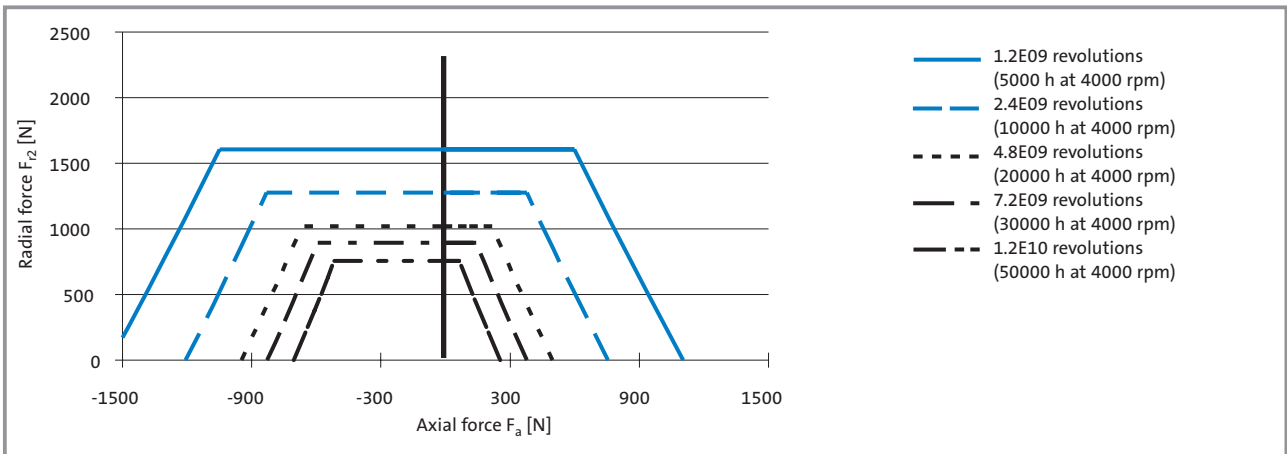

The characteristics are valid for all MCS 14 frame sizes

Permissible radial force F_{r1} and axial force F_a on shaft

Permissible radial force F_{r2} and axial force F_a on shaft

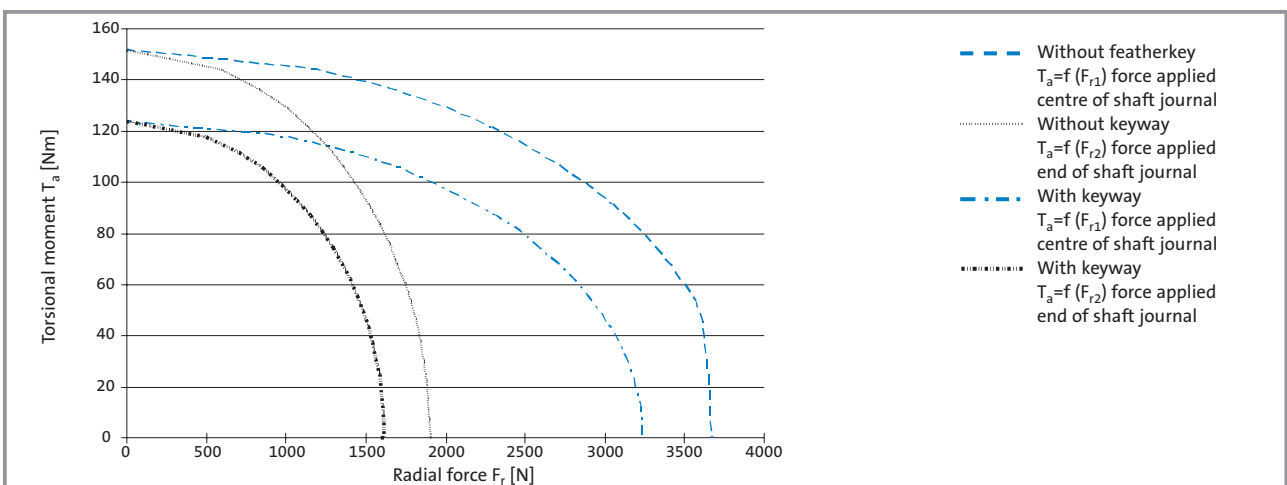

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

Permissible shaft loading

Relationship between radial force and torsional moment on the shaft.

Short-time operation characteristic

Lenze MCS synchronous servo motors are designed to be used in dynamic applications with high torque peaks. In order to make full use of this highly dynamic response as simply as possible, the following diagrams for operating

modes S2 and S6 illustrate the permissible operating times against the torque peaks required.

Technical data

MCS 19 synchronous servo motors

2

Brake assignment

MCS synchronous servo motors can be fitted with integrated permanent magnet holding brakes for 24 V DC.

The brakes are activated when the supply voltage is disconnected (closed-circuit current principle).

If the brakes are used purely as holding brakes, there will be virtually no evidence of wear on the friction surfaces. As long as the permissible switching rate is not exceeded, at least 2000 emergency stop functions will be possible.

Brake assignment MCS 19

Motor	Brake	
	P1	P2
MCS 19F□□	●	
MCS 19J□□		●
MCS 19P□□		●

MCS 19F30, MCS 19F14

Type	Size	Holding torque M_4 20 °C Nm	Holding torque M_4 120 °C Nm	Average dynamic torque M_{1m} 120 °C Nm	U_B ³⁾ +5% – -10% V	I_B ²⁾ A	J_B kg m ² · 10 ⁻⁴	Engage- ment time t_1 ¹⁾ ms	Disen- gage- ment time t_2 ¹⁾ ms	Maximum switching rate per emergency stop with n = 3.000 rpm J	Weight kg
P1	11H	37	32	15	24	0.93	12.4	96	113	2350	1.5

¹⁾ Engagement and disengagement times valid for rated voltage (± 0%) and protective circuit for brakes with varistor for DC-controlled switching. The times may increase without a protective circuit.

²⁾ The currents are maximum values for a cold brake (data for dimensioning the power supply). The values for a motor at operating temperature are considerably lower.

³⁾ Smoothed DC voltage, ripple < 1%.

Permissible moments of inertia

Motor	Brake type	J_{Motor} with brake kg m ² · 10 ⁻⁴	Permissible J_{load} / J_{Motor}
MCS 19F	P1	77.4	5.2

If the permissible moments of inertia opposite are adhered to, the permissible maximum switching rate of the brake will not be exceeded and up to 2000 emergency stop functions will be possible at a speed of 3000 rpm.

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e.g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input. The following applies to Lenze system cables:

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

$$U^*[V] = U_B [V] + 0.08 \left[\frac{V}{A \cdot m} \right] \times l_{cable} [m] \times I_B [A]$$

Permissible shaft loads

Forces on the motor shaft

The following diagrams provide a simple means of determining:

- a) the service life of the roller bearings on the basis of the forces and torques calculated.

Service life is calculated as follows:

$$\frac{\text{Number of bearing revolutions}}{n [\text{rpm}] \times 60} = \text{bearing service life [h]}$$

- b) the maximum permissible radial force and the associated maximum permissible torsional moment on the motor shaft. Depending on the ambient temperatures, the service life of the bearings is also reduced by the grease lifetime.

The characteristics are valid for all MCS 19 frame sizes

Permissible radial force F_{r1} and axial force F_a on shaft

Permissible radial force F_{r2} and axial force F_a on shaft

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive.

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

Permissible shaft loading

Relationship between radial force and torsional moment on the shaft.

Technical data

Terminal box

If an MCS servo motor is to be connected to an existing cable or plug connectors are not to be used for other reasons, the connection can also be made via a terminal box. In order to ensure the required long term vibration resistance of the cable connectors with sufficient contact pressure, tension spring terminals are used. The terminal box features sufficient space for customer wiring and large shield contact surfaces for a safe EMC-

compliant connection. The outgoing cable can be routed to the right or left-hand side according to requirements.

Technical data

Temperature sensors

The thermal sensors used in the MCS motors continually monitor the motor temperature. The temperature information is passed to the servo controller via the system cable of the feedback system. Due to the varying physical conditions, two different types of temperature monitoring mechanisms are used with the MCS motors (neither provide full motor protection).

MCS 06

In this motor, the winding temperature of a winding phase is monitored by a KTY 83-110 thermal sensor.

MCS 09-MCS 19

These motors are monitored by three thermal sensors connected in series (1x KTY 83-110 + 2x PTC 150 °C). This enables the normal operating temperature of the motor to be measured very accurately and also, in the event of an overtemperature in one of the winding phases, allows the controller to carry out the appropriate action.

2

If the sensor is supplied with a measured current of 1 mA, the above relationship between the temperature and the resistance applies.

Note:

To ensure trouble-free operation, the thermal sensor must be connected to the servo controller with the correct polarity.

Details concerning

- Phase angle sensors and tacho generators
- Pin assignment
- System cables
- System connectors

for the MCS synchronous servo motors can be found in Chapter 5.

- Combination possible
- Combination **not** possible

- Engagement and disengagement times valid for rated voltage ($\pm 0\%$) and protective circuit for brakes with varistor for DC-controlled switching. The times may increase without a protective circuit.
- The currents are maximum values for a cold brake (data for dimensioning the power supply). The values for a motor at operating temperature are considerably lower.
- Smoothed DC voltage, ripple 1%.
- UR not possible in the case of a brake with 205 V supply voltage.

Permissible moments of inertia

Motor	Brake	J_{mot} with brake kg m ² · 10 ⁻⁴	Permissible J_{load}/J_{mot}
MCA 10	P1	2.78	24.5
MCA 10	P5	2.78	24.5
MCA 13	P1	9.36	7.7
MCA 13	P5	9.36	7.7

If the permissible moments of inertia opposite are adhered to, the permissible maximum switching rate of the brake will not be exceeded and up to 2000 emergency stop functions will be possible at a speed of 3000 rpm.

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e.g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input.

The following applies to Lenze system cables:

$$U^*[V] = U_B [V] + 0.08 \left[\frac{V}{A \cdot m} \right] \times l_{cable} [m] \times I_B [A]$$

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

3

MCA 17N23...S00

Torque characteristics

MCA 17N35...F10

MCA 17N17...F10

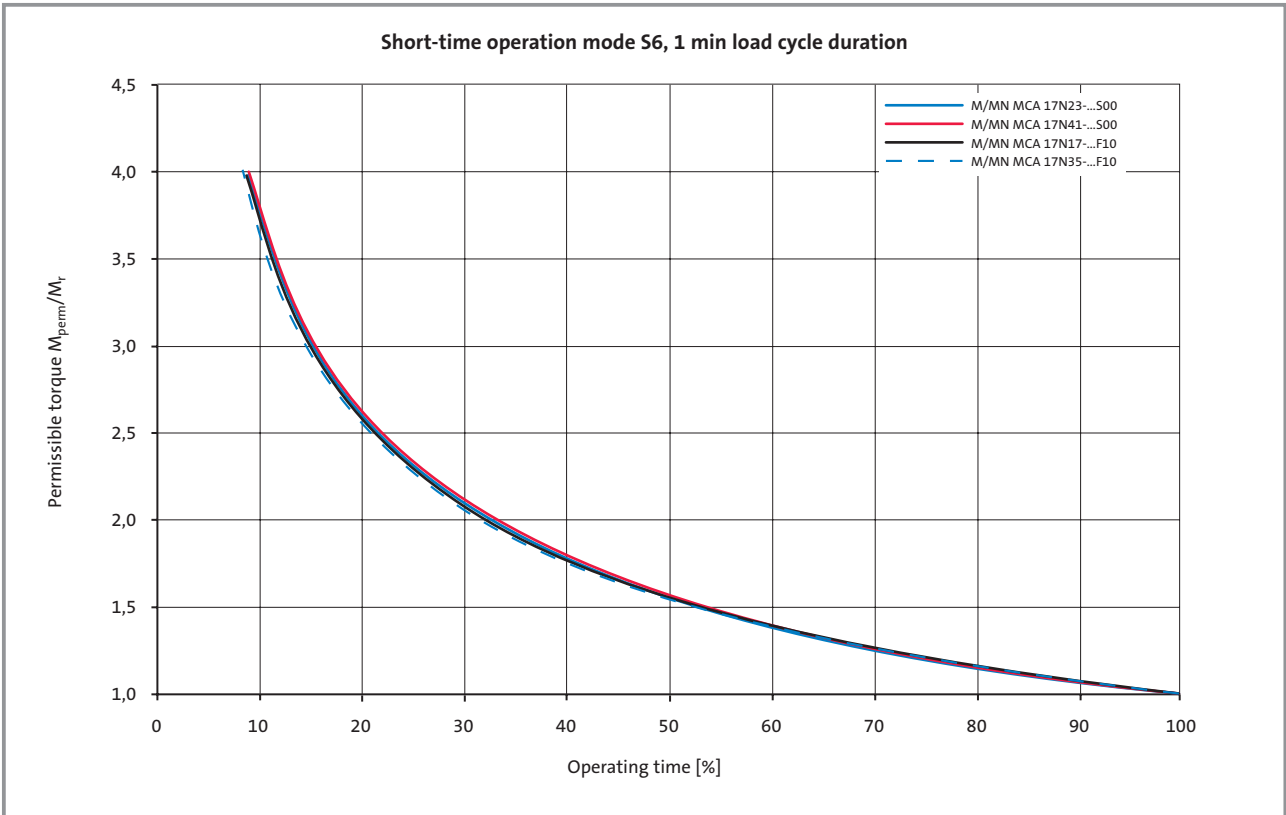

Short-time operation characteristic

Lenze MCA servo motors have high torque peaks. In order to make full use of this highly dynamic response as simply as possible, the following diagrams for operating modes S2

and S6 illustrate the permissible operating times against the torque peaks required.

Brake assignment

The MCA asynchronous servo motors can be fitted with integral permanent magnet holding brakes. Voltages of 24 V DC and 205 V DC are available for this purpose.

The brakes are activated when the supply voltage is disconnected (closed-circuit current principle).

If the brakes are used purely as holding brakes, there will be virtually no evidence of wear on the friction surfaces. As long as the permissible switching rate is not exceeded, at least 2000 emergency stop functions will be possible.

MCA 17

Type	Size	Holding torque M_4 20 °C Nm	Holding torque M_4 120 °C Nm	Average dynam. M_{1m} 120 °C Nm	U_B +5 % – -10 % ³⁾ V	I_{BR} ²⁾ A	J_{BR} kg m ² · 10 ⁻⁴	Engage- ment t_1 ¹⁾ ms	Diseng. time t_2 ¹⁾ ms	Maximum switching rate per emergency stop with n = 3000 rpm J	Weight kg
P1	09H	24.0	22.0	11.0	24	0.75	3.60	25	50	550	1.54
P5 ⁴⁾	09H	24.0	22.0	11.0	205	0.09	3.60	25	50	550	1.54

¹⁾ Engagement and disengagement times valid for rated voltage

(± 0%) and protective circuit for brakes with varistor for DC-controlled switching. The times may increase without a protective circuit.

²⁾ The currents are maximum values for a cold brake (data for dimensioning the power supply). The values for a motor at operating temperature are considerably lower.

³⁾ Smoothed DC voltage, ripple 1%.

⁴⁾ UR not possible in the case of a brake with 205 V supply voltage.

Permissible moments of inertia

Motor	Brake	J_{mot} with brake kg m ² · 10 ⁻⁴	Permissible J_{load}/J_{mot}
MCA 17	P1	39.60	5.1
MCA 17	P5	39.60	5.1

If the permissible moments of inertia opposite are adhered to, the permissible maximum switching rate of the brake will not be exceeded and up to 2000 emergency stop functions will be possible at a speed of 3000 rpm.

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e.g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input.

The following applies to Lenze system cables:

$$U^*[V] = U_B [V] + 0.08 \left[\frac{V}{A \cdot m} \right] \times l_{cable} [m] \times I_B [A]$$

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

Mechanical dimensions

Blower data

U_N	f_N	I_N	P_N
[V]	[Hz]	[A]	[W]
210...240, 1 ph.	50/60	0.32	46

Permissible shaft loads

Forces on the motor shaft

The following diagrams provide a simple means of determining:

- a) the service life of the roller bearings on the basis of the forces and torques calculated.

Service life is calculated as follows:

$$\frac{\text{Number of bearing revolutions}}{n [\text{rpm}] \times 60} = \text{bearing service life [h]}$$

- b) the maximum permissible radial force and the associated maximum permissible torsional moment on the motor shaft. Depending on the ambient temperatures, the service life of the bearings is also reduced by the grease lifetime.

3

The curves apply to MCA 17

Permissible radial force F_{r1} and axial force F_a on shaft

Permissible radial force F_{r2} and axial force F_a on shaft

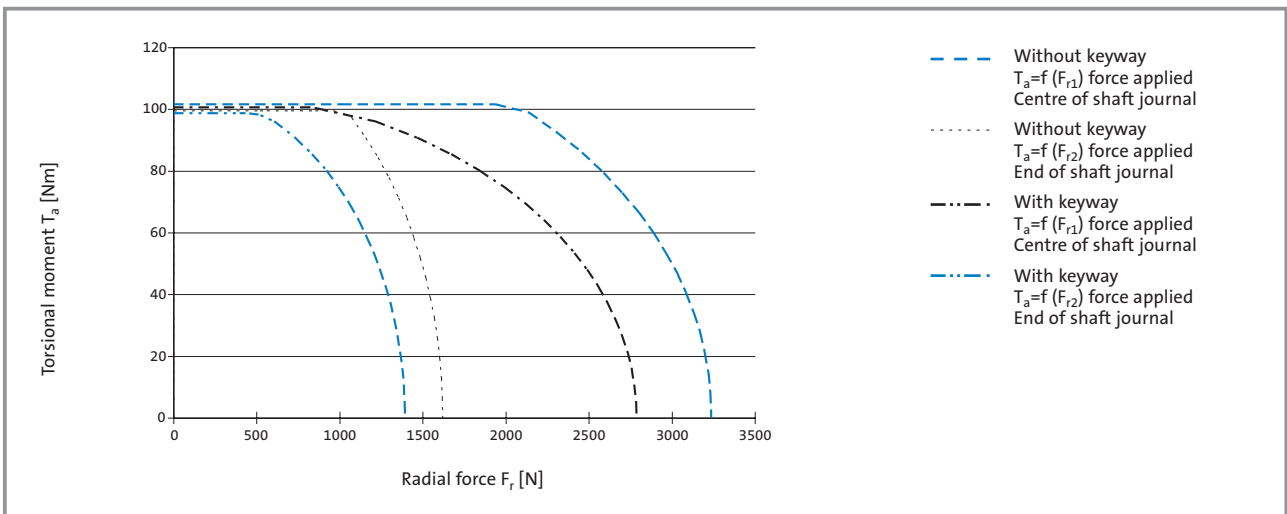

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

Permissible shaft loading

Relationship between radial force and torsional moment on the shaft.

MCA 19	P1	81.50	3.7
MCA 19	P5	81.50	3.7

If the permissible moments of inertia opposite are adhered to, the permissible maximum switching rate of the brake will not be exceeded and up to 2000 emergency stop functions will be possible at a speed of 3000 rpm.

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e.g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input.

The following applies to Lenze system cables:

$$U^*[V] = U_B [V] + 0.08 \left[\frac{V}{A \cdot m} \right] \times l_{cable} [m] \times I_B [A]$$

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive.

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

Permissible shaft loading

Relationship between radial force and torsional moment on the shaft.

Terminal box

If an MCA servo motor is to be connected to an existing cable or plug connectors are not to be used for other reasons, the connection can also be made via terminal box.

The motor can either be fitted with a terminal box for the power connection and motor holding brake or a second terminal box provided to connect the motor feedback and fan (if applicable).

Terminal box for power connection and motor holding brake

¹⁾ Caution: Specified torques for max. heatsink temperature 9300 = 80 °C and 400 V mains supply; at heatsink temperatures < 80 °C the permissible maximum current increases on the 9300 and a chopper frequency of 8 kHz.

²⁾ On the 9329, 9330, 9331 and 9332 at frequencies > 5 Hz, derating below 5 Hz.

⁴⁾ The reduction in torque must be taken into account in applications that have an active load (e.g. vertical motion drives, hoists, test benches, unwinders). In applications with passive loads (e.g. horizontal motion drives) the reduction can usually be ignored.

MDFQA 112-22, 100, Delta connection with blower

Short-time operation characteristic

Lenze MDFQA servo motors can generate high torque peaks. In order to make full use of this highly dynamic response as simply as possible, without overloading the motor, the fol-

lowing diagrams for operating modes S2 and S6 illustrate the permissible operating times against the torque peaks required.

Technical data

MDFQA 100/112 asynchronous servo motors

Brake assignment

MDFQA asynchronous servo motors can be fitted with integral spring-applied holding brakes. Voltages of 24 V DC and 205 V DC are available for this purpose.

The brakes are activated when the supply voltage is disconnected (closed-circuit current principle).

If the brakes are being used as pure holding brakes, then there will be practically no wear on the friction surfaces.

1) Characteristic torques are with reference to the relative speed $\Delta n = 100$ rpm.

2) Engagement and disengagement times valid for rated voltage ($\pm 0\%$) and protective circuit for brakes with spark suppressors. The times may increase without a protective circuit. The operating times are mean values. The leakage depends on the type of rectifier, the air path and the coil current.

2) Engagement times with DC side switching, in the case of AC side switching t_1 increases by a factor of about 6.

4) The currents are maximum values for a cold brake (data for dimensioning the power supply). The values for a motor at operating temperature are considerably lower.

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e.g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input.

The following applies to Lenze system cables:

$$U^*[V] = U_B [V] + 0.08 \left[\frac{V}{A \cdot m} \right] \times I_{cable} [m] \times I_B [A]$$

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

Permissible shaft loads

Forces on the motor shaft

The following diagrams provide a simple means of determining:

- a) the service life of the roller bearings on the basis of the forces and torques calculated.

Service life is calculated as follows:

$$\frac{\text{Number of bearing revolutions}}{n [\text{rpm}] \times 60} = \text{bearing service life [h]}$$

- b) the maximum permissible radial force and the associated maximum permissible torsional moment on the motor shaft. Depending on the ambient temperatures, the service life of the bearings is also reduced by the grease lifetime.

The curves apply to all MDFQA 100 versions

Permissible radial force F_{r1} and axial force F_a on shaft

Permissible radial force F_{r2} and axial force F_a on shaft

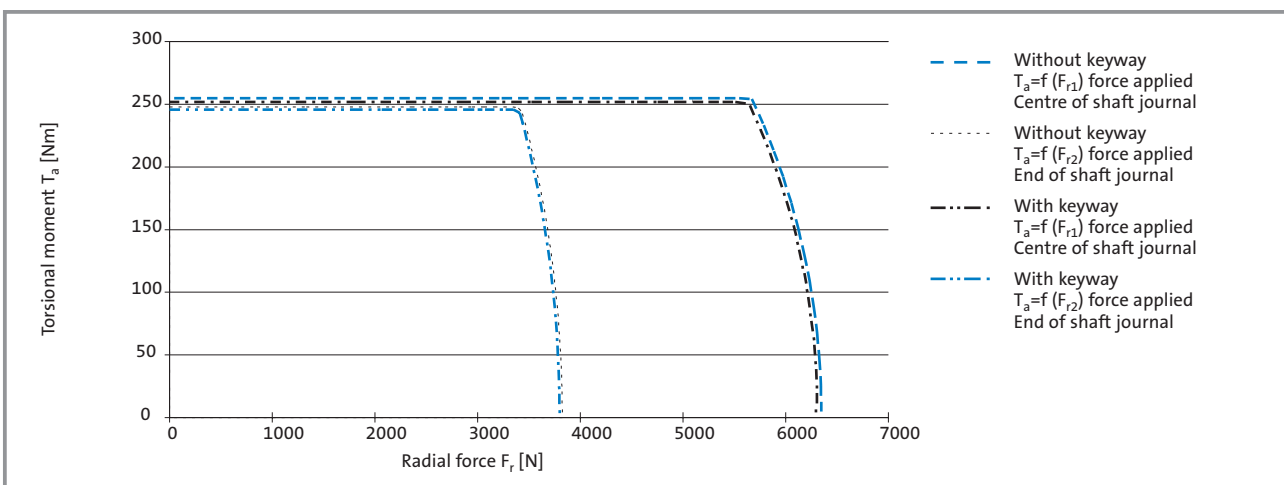

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive.

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

Permissible shaft loading

Relationship between radial force and torsional moment on the shaft.

Permissible shaft loads

Forces on the motor shaft

The following diagrams provide a simple means of determining:

- a) the service life of the roller bearings on the basis of the forces and torques calculated.

Service life is calculated as follows:

$$\frac{\text{Number of bearing revolutions}}{n \text{ [rpm]} \times 60} = \text{bearing service life [h]}$$

- b) the maximum permissible radial force and the associated maximum permissible torsional moment on the motor shaft. Depending on the ambient temperatures, the service life of the bearings is also reduced by the grease lifetime.

The curves apply to all MDFQA 112 versions

Permissible radial force F_{r1} and axial force F_a on shaft

Permissible radial force F_{r2} and axial force F_a on shaft

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive.

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

¹⁾ Caution: Specified torques for max. heatsink temperature

9300 = 80 °C and 400 V mains supply; at heatsink temperatures < 80 °C the permissible maximum current increases on the 9300 and a chopper frequency of 8 kHz.

²⁾ On the 9329, 9330, 9331 and 9332 at frequencies > 5 Hz, derating below 5 Hz.

⁴⁾ The reduction in torque must be taken into account in applications that have an active load (e.g. vertical motion drives, hoists, test benches, unwinders). In applications with passive loads (e.g. horizontal motion drives) the reduction can usually be ignored.

Short-time operation characteristic

Lenze MDFQA servo motors can generate high torque peaks. In order to make full use of this highly dynamic response as simply as possible, without overloading the motor, the fol-

lowing diagrams for operating modes S2 and S6 illustrate the permissible operating times against the torque peaks required.

Brake assignment

MDFQA asynchronous servo motors can be fitted with integral spring-applied holding brakes. Voltages of 24 V DC and 205 V DC are available for this purpose.

The brakes are activated when the supply voltage is disconnected (closed-circuit current principle).

If the brakes are being used as pure holding brakes, then there will be practically no wear on the friction surfaces.

1) Characteristic torques are with reference to the relative speed $\Delta n = 100\ rpm$.

2) Engagement and disengagement times valid for rated voltage ($\pm 0\ %$) and protective circuit for brakes with spark suppressors. The times may increase without a protective circuit. The operating times are mean values. The leakage depends on the type of rectifier, the air path and the coil current.

3) Engagement times with DC side switching, in the case of AC side switching t_1 increases by a factor of about 6.

4) For 24V DC brake: smoothed DC voltage, ripple 1 %.

4) The currents are maximum values for a cold brake (data for dimensioning the power supply). The values for a motor at operating temperature are considerably lower.

Caution:

The brakes used are not fail-safe brakes in the true sense because certain types of fault, e.g. oil leakage, will cause a loss of torque.

If long motor cables are being used, the ohmic voltage drop along the cable should be taken into account and compensated for by applying a higher voltage at the cable input.

The following applies to Lenze system cables:

$$U^*[V] = U_B [V] + 0.08 \left[\frac{V}{A \cdot m} \right] \times l_{cable} [m] \times I_B [A]$$

If an appropriate voltage is not supplied to the brake (incorrect dimension, incorrect polarity), the brake will fail to release and the continuing rotation of the motor could cause it to overheat, leading to irreparable damage.

DC voltage switching helps to minimise brake response times. A spark suppressor is required for interference suppression and to increase the service life of the relay contacts.

Permissible shaft loads

Forces on the motor shaft

The following diagrams provide a simple means of determining:

- a) the service life of the roller bearings on the basis of the forces and torques calculated.

Service life is calculated as follows:

$$\frac{\text{Number of bearing revolutions}}{n \text{ [rpm]} \times 60} = \text{bearing service life [h]}$$

- b) the maximum permissible radial force and the associated maximum permissible torsional moment on the motor shaft. Depending on the ambient temperatures, the service life of the bearings is also reduced by the grease lifetime.

The curves apply to all MDFQA 132 versions

Permissible radial force F_{r1} and axial force F_a on shaft

Permissible radial force F_{r2} and axial force F_a on shaft

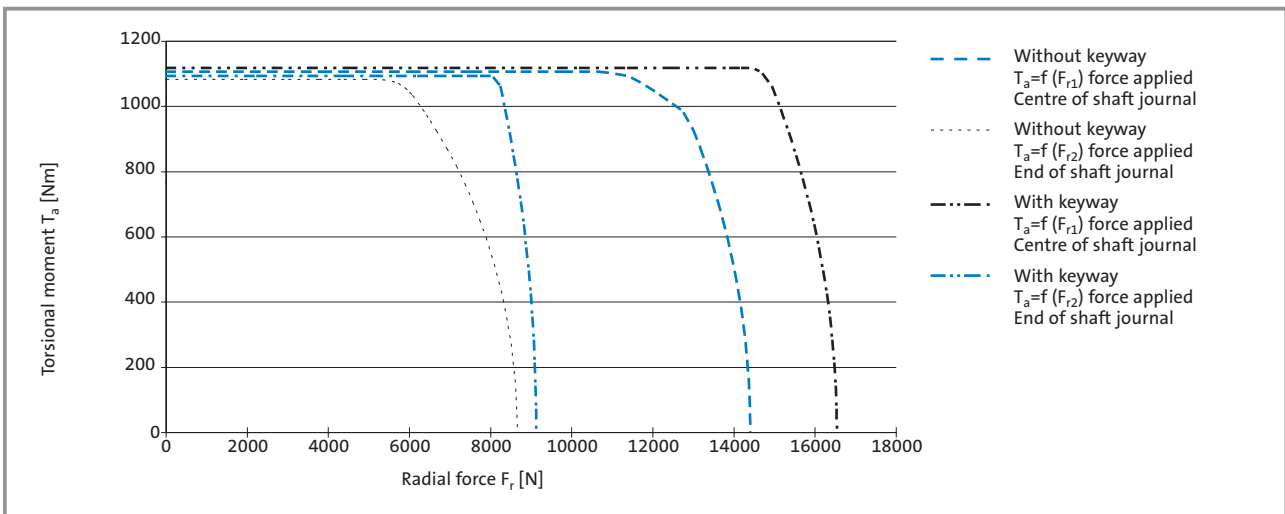

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive.

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

Permissible shaft loading

Relationship between radial force and torsional moment on the shaft.

Permissible shaft loads

Forces on the motor shaft

The following diagrams provide a simple means of determining:

- a) the service life of the roller bearings on the basis of the forces and torques calculated.

Service life is calculated as follows:

$$\frac{\text{Number of bearing revolutions}}{n [\text{rpm}] \times 60} = \text{bearing service life [h]}$$

- b) the maximum permissible radial force and the associated maximum permissible torsional moment on the motor shaft. Depending on the ambient temperatures, the service life of the bearings is also reduced by the grease lifetime.

The curves apply to all MDFQA 160 versions

Permissible radial force F_{r1} and axial force F_a on shaft

Permissible radial force F_{r2} and axial force F_a on shaft

Bearing service life

Relationship between the number of total bearing revolutions, bearing service life and the average speed of the drive.

The bearing runtime L_{10} indicates that 90% of the bearings will still be intact at the end of this period.

Permissible shaft loading

Relationship between radial force and torsional moment on the shaft.

Motor connection

The power and fan connections on the MDFQA asynchronous servo motors are always made to separate terminal boxes.

If the motors have feedback and/or holding brakes, the encoder and/or the holding brake are connected using separate connectors.

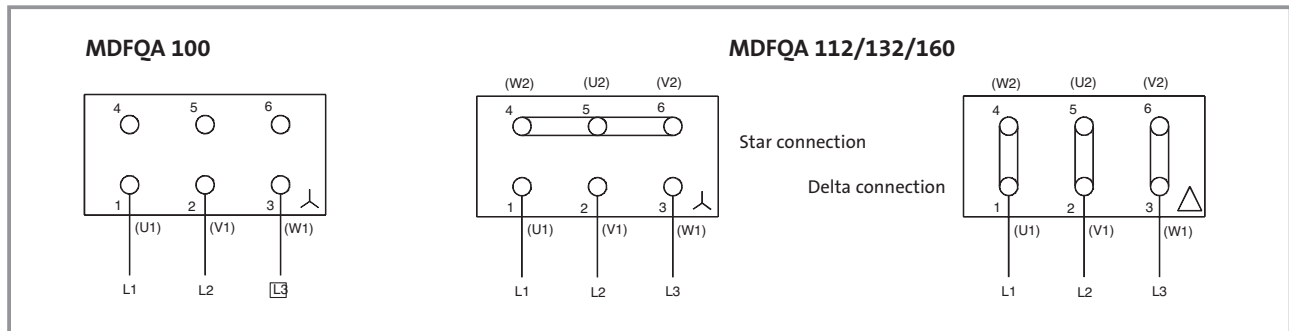

Terminal box for power connection

Terminals

	Terminal designation

Resolver

Stator-fed resolver with two 90° stator windings and one rotor winding with transformer winding.

Abbreviation	RS0
Resolution	0.8°
Accuracy	±10'
Absolute position control	1 revolution
Design	Brushless hollow shaft "pancake" resolver
Max. speed (continuous)	8000 rpm
Max. speed (short-time)	10000 rpm
Input voltage	10 V amplitude
Input frequency	4 kHz
Stator/rotor ratio	0.3 ± 5%
Rotor impedance Z_{ro}	51 Ω + j90 Ω
Stator impedance Z_{so}	102 Ω + j150 Ω
Impedance Z_{rs}	44 Ω + j76 Ω
Insulation resistance	>10 MΩ at 500 V DC
Number of pole pairs	1
Max. phase-angle error	±10 angular minutes
Connector type	EWS0006

MDFQA 160	DNG 6-35 with or without filter with wide range mains		350...540, 3~	50/60	1.4	650

Installation:

the motors are suitable for all mounting positions but the protection type requirements are only met with horizontal installation (connector / terminal box position on top).

*Asynchronous servo motor
MCA 14 with built-on blower
and shaft end for direct gear-
box attachment.*

Overview of system cables

An extensive selection of connecting cables for the power connection, the various encoder systems and the fan connection is available for all Lenze servo motors.

All cables are available for fixed installation or as trailing cables.

The length of all cable types can be freely selected in line with the application in steps of 0.1 m from 0.5 m to 500 m upwards. Please note that certain cable lengths should not be exceeded depending on the controller and feedback system that is being used.

The cables can be assembled in line with your individual requirements in accordance with the following:

- ▶ Connection on motor – cable type – connection on controller

All cable types can be arranged as required. The following arrangements are therefore possible :

- ▶ Motor – Cable – Controller
- ▶ Motor – Cable 1 – Cable 2 – ... – Cable n – Controller

This applies for permanently installed cables and trailing cables. Both versions can also be combined as required.

All connectors are designed application-specific (power, fan, resolver, encoder) thus ensuring that the possibility of an incorrect connection can be practically excluded during assembly and when servicing.

Further detailed information relating to the required cable assembly can be found in the tables below.

Here, your cable can be freely assembled from the following components.

Connection on motor	Cable type	Connection on controller
Connector (socket) or free cable end for terminal box connection	Power cable with wire cross sections of 1 mm ² to 16 mm ² (motor), as well as encoder cables, optimised for the various feedback systems and fan cables	Connector (encoder cable) as well as free cable end (power) for connection on servo controller or connector (pin) for the connection of various cable types (e.g. trailing cable to permanently installed cable)

All cables* available for permanent installation or as trailing cable.

* Exception: the trailing cable for SinCos and incremental encoder (type 0019) can **only** be used as an intermediate cable.

Type code for system cables

	<u>a a a</u>	<u>b b b b</u>	<u>c</u>	<u>l l l l</u>	<u>m m m</u>	<u>r r r</u>
Cable type	_____					
Motor cable	_____ EYP					
Encoder cable	_____ EYF					
Blower cable	_____ EYL					
Code for cable type	_____					
Please select from tables "Cable codes" and "Assignment of motor cable/connector"						
Utilisation type	_____					
Connecting cable	_____ A					
Extension	_____ V					
Cable without connector	_____ Y					
Cable length [dm]	_____					
Minimum length	0.5 m \pm 5 dm					
Maximum length	500 m \pm 5000 dm					
Examples:						
Length [m]	"l l l l"					
0.7 m	0007					
14.5m	0145					
Connection on motor	please select from tables pages 5-10 to 5-13					
Connection on controller	please select from tables pages 5-10 to 5-13					

Example:

- ▶ Connecting cable for motor, 4x 2.5 mm², Length 17.6 m, fixed installation, for connection to servo controller, plug-in connection on motor
Order no.: EYP 0005 A 0176 M02 A00

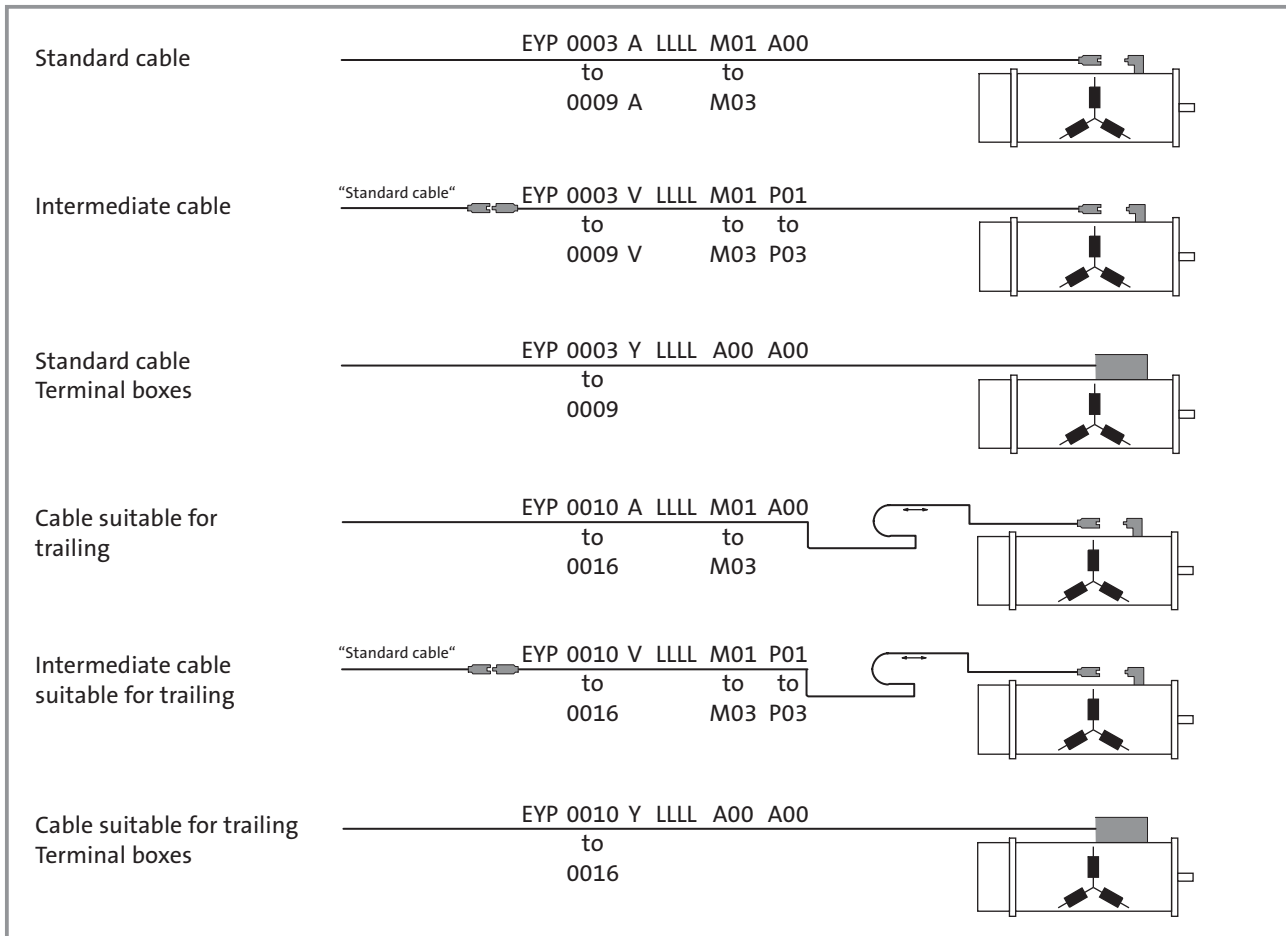

- ▶ A resolver should be connected to a servo controller. Depending on the system, it may be necessary to use a trailing cable for the connection on the motor side, otherwise the cable can be permanently installed. Connectors are provided on the controller and on the motor.
Length of trailing cable: 12.5 m,
Length for permanent installation: 15.9 m

Hence, there are two different cables:
trailing cable:
order no.: EYF 0020 V 0125 F01 G01
permanently installed:
order no.: EYF 0017 A 0159 F01 S01

all motors MDFQA	L02 1)	A00	permanent trailing cable	0001 0002	J02	A00

1) Plug-in connection only possible for intermediate cable, connection to motor only via terminal box.

System connectors

For applications in which Lenze system cables cannot be used but motors with plug connectors are to be used, Lenze can provide appropriate connectors for the assembly of cable sets by the customer.

Various connectors with pin or socket contacts that correspond with the power requirements of the motor and the connection type (power, fan, encoder) are available.

Details relating to the assignment of the connector type to the frame sizes can be found in the table to the right. Details relating to the connection assignments can follow.

For us, service is more than just supporting the use of our drives. The Lenze system approach begins with your enquiry. Next you get technical information and advice from a network of sales outlets staffed by knowledgeable engineers. If you want, we follow up with training, commissioning, maintenance and repair. Our service is always at your disposal.

With passion

The Lenze team does not just offer the necessary manpower and technical know-how – we are passionate and meticulous about what we do. We will only be happy once you are entirely satisfied with our work. Our team of professionals provides assistance over the telephone or on site, ensures the express delivery of spare parts and carries out repairs with incredible urgency. We're fast and reliable.

Someone to talk to

Expert advice is available for all your technical queries via our helpline. In cases of urgent need, call 008000 24 hours (008000 24 46877), Lenze's worldwide expert helpline – 24 hours a day, 365 days a year. For more direct assistance, you can of course contact your local Lenze service support centre. We can tell you where it is – or you can find out for yourself by visiting us on the Internet at www.Lenze.com.

Around the world

Our products are available for speedy delivery worldwide. Lenze companies, Lenze factories and sales agencies are based in major industrial countries around the world. Contact them through our website www.Lenze.com, which also gives you 24-hour access to technical instructions and product manuals. Local support, on site if you need it, is available.

Technical documentation

The technical documentation provides more detailed information about our products:

- ▶ Mounting Instructions in three languages are supplied with our products.
- ▶ Our System Manuals for controllers, our Communication Manuals for bus systems and our Operating Instructions for electromechanical products and accessories provide the information required for planning, designing and developing machines and systems. System Manuals and Communication Manuals are supplied in loose-leaf format. Operating Instructions are bound.
- ▶ Our User's Manuals for our controllers are designed for the operators and users of machines and systems. The information in User's Manuals has been put together so that it can be integrated directly into the machine or system documentation.

All our technical documentation is available free of charge in PDF format

- ▶ Via Internet download from "www.lenze.de", "Downloads" area
- ▶ On the "Lenze Library" CD

System Manuals and Communication Manuals can also be supplied in ring binder format for a nominal fee.

Technical documentation at a glance

Documentation	Contents	Target group	Available languages
Mounting Instructions	Safety instructions, handling and installation	Installation personnel	In three languages: German, English, French
System manual Communication manual Operating instructions	Extensive and comprehensive information for design, construction, development and programming	Planning engineers, design engineers and developers of machines and systems	Single-language version: German, English or French
User's manual	Safety instructions, handling, troubleshooting and fault elimination	Operators and users of machines and systems	Single-language version German, English or French. Other languages will shortly be available on request

Line voltage

- 400 V 230 V (230 V only possible for MCS 06, MCS 09, MCS 12H, MCS 12L20)

Encoder

- Resolver
- SinCos encoder
Single-turn
SRS 50
- SinCos encoder
Multi-turn
SRM 50 (SinCos encoder SCS70/SCM70 for 93□□ on request)

Brake

- no brake
- with PM brake
24 V DC
- with PM brake, reinforced
24 V DC (not on MCS 06, MCS 19)

Flange and shaft

- B5 standard flange form A/FF
Shaft without featherkey
- B5 standard flange form A/FF
Shaft with featherkey

Electrical connection

- Separate plug connectors for
power/brake
encoder/temperature
- Terminal box for
power/brake/encoder/temperature
(not on MCS 06)

Enclosure

- IP54 without shaft sealing ring
- IP65 with shaft sealing ring

Thermal protection

- KTY sensor

Nameplate

- international nameplate
- second nameplate,
supplied loose

* Countries connected to the free expert helpline 008000 24 hours (008000 24 46877)

It's good to know | why we are there for you

"Our customers come first. Customer satisfaction is what motivates us. By thinking in terms of how we can add value for our customers we can increase productivity through reliability."

"The world is our marketplace. We develop and manufacture internationally. Wherever you are in the world, we are nearby."

"We will provide you with exactly what you need – perfectly co-ordinated products and solutions with the right functions for your machines and installations. That is what we mean by 'quality'."

"Take advantage of our wealth of expertise. For more than 50 years we have been gathering experience in various fields and implementing it consistently and rigorously in our products, motion functions and preprepared solutions for industry."

"We identify with your targets and strive towards a long-term partnership which benefits both sides. Our competent support and consultation process means that we can provide you with tailor-made solutions. We are there for you and can offer assistance in all of the key processes."

You can rely on our service. Expert advice is available 24 hours a day, 365 days a year, in more than 30 countries via our international helpline: 008000 24 Hours (008000 2446877).
